

# BoneDry

Every spill you contain is soil you keep clean  
for the next generation.

THE BOTTOM LINE

Contaminated soil can be scarred for a generation. What  
never reaches the ground can never compromise the  
resource.

THE PROJECT ENDS. THE LAND KEEPS PRODUCING.

A drilling program or jobsite is temporary — the land it sits on is not. BoneDry keeps hydrocarbons from ever reaching the soil, so the ground you work today stays productive for the crops, cattle, and communities that depend on it tomorrow.

BoneDry isn't just faster cleanup — it's a preservation decision. By locking up oil and fuel the instant they hit the ground, you protect the soil resource itself, not only the surface.

HOW BONEDRY PRESERVES THE RESOURCE

- Encapsulates oil & fuel on contact — locked up before it can leach into soil
- Silica-free & safe — no crystalline silica dust for crews or land
- Faster, smaller cleanup — far less spent material to haul off and landfill
- Leaves clean, uncompromised earth behind — the resource stays intact

PROTECTS ACROSS THE JOBSITE

- Fueling & transfer points
- Fleet maintenance yards
- Equipment laydown
- Refinery & terminal ops
- Spill response kits

VALUE ON BOTH SIDES OF THE LEASE

FOR LANDOWNERS

Your ground stays clean and productive — the asset holds its value long after the lease ends.

FOR OPERATORS

Demonstrable spill stewardship that supports SPCC compliance and your license to operate.
